**JOINT LETTER TO WHO**

**WHO 25 Expert Committee on Selection and  
Use of Essential Medicine World  
Health Organization**

**Subject: Support for WFH Applications to the WHO Model List of Essential  
Medicines -2025 Update**

Dear Colleagues,

It is widely recognized that recent advancements in medical science have transformed hemophilia care, leading to significantly improved health outcomes and quality of life for patients. access to innovative therapies-such as recombinant factors and emicizumab-is especially important for countries striving to improve standards of care and reduce treatment gaps.

We commend the wfh for its continued leadership and advocacy in ensuring that the who essential medicines list (eml) reflects current evidence-based best practices in the treatment of hemophilia and von willebrand disease. these updates are critical for improving access to safe, effective, and life-saving therapies for individuals living with bleeding disorders across the globe.

The applications we support are as follows:

- Changes to the listings of cryoprecipitate, pathogen-reduced cryoprecipitate, and plasma-derived clotting factor concentrates
- Inclusion of recombinant coagulation factors – for hemophilia
- Inclusion of emicizumab-for hemophilia A

Hemophilia center of the Mongol-japan hospital at the Mongolian national university of medical sciences stand in strong support of the wfh's application.
