DISCLAIMER

Disruptions to health systems can impede provision of and access to essential health services. Communities’ vulnerability to increased morbidity and mortality substantially increases when a lack of reliable information prevents sound decision-making, especially in rapidly changing environments requiring continued assessment. The Health Resources and Services Availability Monitoring System (HeRAMS) aims to provide decision-makers and health stakeholders at large with vital and up-to-date information on the availability of essential health resources and services, help them identify gaps and determine priorities for intervention.

HeRAMS draws on the wealth of experience and knowledge gathered by the World Health Organization (WHO) and health sector actors, including nongovernmental organizations (NGOs), donors, academic institutions and other technical bodies. It builds on a collaborative approach involving health service providers at large and integrating what is methodologically sound and feasible in highly constrained, low-resourced and rapidly changing environments such as humanitarian emergencies. Rapidly deployable and scalable to support emergency response and fragile states, HeRAMS can also be expanded to - or directly implemented as - an essential component of routine health information systems. Its modularity and scalability make it an essential component of emergency preparedness and response, health systems strengthening, universal health coverage and the humanitarian development nexus.

HeRAMS has been deployed in Afghanistan since November 2021 and has allowed for the assessment of 2730 health facilities across the country, against a total estimate of 3012 to date.

This analysis was produced based on the data collected up to March 22nd 2022 and while the deployment of HeRAMS, including data verification and validation, continue. Hence, this analysis is not final and is produced solely for the purposes of informing operations.

This is the first report of the HeRAMS Afghanistan Baseline Report 2022 series focusing on the operational status of health facilities, level and type of support provided by partners, and availability of basic amenities. For more in-depth information on the availability of essential health services and main barriers impeding service delivery, specialized reports are available on essential clinical and trauma care services¹, child health and nutrition services², communicable disease services³, sexual and reproductive health services⁴, and non-communicable disease and mental health services⁵.

Caution must be taken when interpreting the results presented in this report. Differences between information products published by WHO, national public health authorities, and other sources using different inclusion criteria and different data cut-off times are to be expected. While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change.

For additional information, please see https://www.who.int/initiatives/herams or contact herams@who.int

INTERPRETATION GUIDE

Indicator status

Arc charts
For each indicator, an arc chart provides an overview of the overall status (i.e. functionality, availability, sufficiency, etc.), hereafter referred to as "availability". The total number of health facilities included in the analysis of an indicator is shown inside the arc chart. It is important to note that the total number of health facilities included in the analysis of an indicator can vary due to the exclusion of non-operational and non-reporting health facilities from subsequent analyses (see page 5 for details).

The status of an indicator is further broken down by region and or type of health facility.

Column charts
Column charts display the status of an indicator by region or province. The number of health facilities in a region or province is shown below the region's name.

Donut charts
Each donut chart represents a type of health facility. The percentage of health facilities for which the indicators was available or partially available is shown inside the donut while the total number of health facilities included is shown at the bottom of the chart, below the health facility type name. If an indicator was not available in any health facility, the number inside the chart will display the percentage of health facilities for which the indicator was partially or not available.

Maps
In contrast to charts and to highlight areas not reporting, respectively the impact of non-operational health facilities, maps depict all health facilities included in the HeRAMS assessment. Each circle corresponds to the cumulative number of health facilities in a province and may be divided in up to four smaller circles with the smallest circle indicating the proportion of health facilities assessed for the selected indicator. By default, the color of the innermost circle represents the percentage of health facilities for which the indicator is fully available. If an indicator is not expected or not applicable in some health facilities, a gray circle indicates the percentage of health facilities excluded from the analysis. Any deviation from this is clearly stated in the map legend. Non-reporting and non-operational health facilities are depicted in distinct colors and form two outer circle around the evaluated health facilities.

In the example shown on the right, the cumulative size of the circles corresponds to 15 health facilities. The smallest circle indicates the proportion of operational health facilities where the indicator is applicable (1) followed by the proportion of operational health facilities evaluated but where the indicator is not applicable (4). The two lighter shades of gray indicate the proportion of non-operational (5) and non-reporting (5) health facilities.

For each circle, the corresponding province name is shown in the map label together with the total number of health facilities evaluated (excluding health facilities where the indicator is not applicable) and the percentage of evaluated health facilities for which the indicator was fully available.
Reasons of unavailability

If an indicator was not or only partially available, main reasons of unavailability (i.e. causes of damage, reasons for non-functionality, etc.) were collected. Similarly, indicators assessing availability and sufficiency of basic amenities may have a sub-question gathering additional information on the type of amenity available. Alike reasons of unavailability, types of amenities are only evaluated if the amenity was at least partially available. For simplicity reasons, causes of damage, non-functionality and inaccessibility, reasons of unavailability, types of basic amenities, and type of support provided by partners are hereafter commonly referred to as "reasons".

**Donut charts**

Each donut chart indicates the percentage of health facilities having reported a given reason. The total number of health facilities reporting at least one reasons is shown below the chart header.

**Bar chart**

Bar charts depicting reasons follow the same logic as donut charts and exclude health facilities where the indicator was fully available. The number of health facilities reporting at least one reason is displayed below the region's name.

**Important:** The denominators for reasons charts exclude health facilities where the indicator was fully available or in the case of basic amenities not available. It should further be noted that health facilities could report up to three reasons for each indicator. Thus, the sum of all reasons may exceed 100%.
OVERVIEW OF HEALTH FACILITIES EVALUATED

Summary of health facilities evaluated

3012 Health facilities targeted

2730 Health facilities evaluated

Building damage

- 237 Not reporting
- 3 Closed

Operational health facilities by province

Operational hospitals by province

---

9 Includes fully and partially operational Basic and Comprehensive Health Centers (BHB/BHB+, CHC/CHC+), Sub Health Centers (SHC), Family Health Houses (FHH), Mobile Health Teams (MHT) and First Aid Trauma Posts (FATP).

10 Includes fully and partially functional Specialist Hospitals (SH), National hospitals (NH), Regional Hospital (RH), Provincial Hospital (PH) and District Hospitals (DH).

11 Recommended minimum coverage: one district or rural hospital per 250,000 people (source: SPHERE handbook https://handbook.spherestandards.org/en/sphere/#ch009 [accessed: 2022-03-25]).

Water availability

Availability of sanitation facilities by region

Main reasons of unavailability

Main reasons of unavailability by region

Water is considered fully available if water is available in sufficient quantities and qualities within the premises of the health facility. Water should either come from improved water sources or should be treated on-site following national guidelines.

Sanitation

Availability of sanitation facilities

Availability of sanitation facilities

Main reasons of unavailability

Main reasons of unavailability by region

Sanitation facilities are considered available if the health facility has sufficient improved and usable sanitation facilities with at least one toilet reserved for staff, at least one sex-separated toilet with facilities for menstrual hygiene, and at least one toilet accessible to users with reduced mobility.
