Disclaimer

Disruptions to health systems can impede provision of and access to essential health services. Communities’ vulnerability to increased morbidity and mortality substantially increases when a lack of reliable information prevents sound decision-making, especially in rapidly changing environments requiring continued assessment. The Health Resources and Services Availability Monitoring System (HeRAMS) aims to provide decision-makers and health stakeholders at large with vital and up-to-date information on the availability of essential health resources and services, help them identify gaps and determine priorities for intervention.

HeRAMS draws on the wealth of experience and knowledge gathered by the World Health Organization (WHO) and health sector actors, including nongovernmental organizations (NGOs), donors, academic institutions and other technical bodies. It builds on a collaborative approach involving health service providers at large and integrating what is methodologically sound and feasible in highly constrained, low-resourced and rapidly changing environments such as humanitarian emergencies. Rapidly deployable and scalable to support emergency response and fragile states, HeRAMS can also be expanded to - or directly implemented as - an essential component of routine health information systems. Its modularity and scalability make it an essential component of emergency preparedness and response, health systems strengthening, universal health coverage and the humanitarian development nexus.

HeRAMS has been deployed in Afghanistan since November 2021. This analysis presents the results of the assessment of 3884 health facilities across the country, against estimated total of 4238 health facilities, and is based on data reported as of January 18th, 2023. While the deployment of HeRAMS remains ongoing and data verification and validation continue, the analysis presented here is not final and has been produced solely to inform operations.

This is the first report of the HeRAMS Afghanistan Status Update Report January 2023 series focusing on the operational status of health facilities, level and type of support provided by partners, and availability of basic amenities. For more in-depth information on the availability of essential health services and main barriers impeding service delivery, specialized reports are available on essential clinical and trauma care services, child health and nutrition services, communicable disease services, sexual and reproductive health services, and non-communicable disease and mental health services.

Caution must be taken when interpreting the results presented in this report. Differences between information products published by WHO, national public health authorities, and other sources using different inclusion criteria and different data cut-off times are to be expected. While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change.

For additional information, please see https://www.who.int/initiatives/herams or contact herams@who.int

## INTERPRETATION GUIDE

### Indicator status

#### Arc charts

For each indicator, an arc chart provides an overview of the overall status (i.e., functionality, availability, etc.), hereafter referred to as "availability". The total number of health facilities included in the analysis of an indicator is shown inside the arc chart. It is important to note that the total number of health facilities included can vary due to the exclusion of non-operational and non-reporting health facilities from subsequent analyses (see page 6 for details).

#### Column charts

Column charts display the status of an indicator by region or province. The number of health facilities in a region or province is shown below the location's name. By default, all column charts exclude health facilities where an indicator was not applicable or not relevant.

#### Donut charts

Each donut chart represents a type of health facility. The percentage of health facilities for which the indicators was available or partially available is shown inside the donut while the total number of health facilities included is shown at the bottom of the chart, below the health facility type name. If an indicator was not available in any health facility, the number inside the chart will display the percentage of health facilities for which the indicator was partially or not available.

#### Maps

Maps display the availability of an indicator at the province level. In contrast to charts and to highlight areas not reporting, respectively the impact of non-operational health facilities, maps depict all health facilities included in the HeRAMS assessment. The outermost circle corresponds to the cumulative number of health facilities in a province. Each circle may be divided into multiple smaller circles, with each color representing the proportion of health facilities of a specific availability status.

For each circle, the corresponding province name is shown in the map label together with the total number of health facilities evaluated (excluding non-reporting health facilities and health facilities where the indicator is not applicable or not relevant). The second number displays by default the percentage of evaluated health facilities for which the indicator was fully available. Any deviation from this is clearly stated in the map legend.
Barriers
To gain further insights on main barriers impeding availability of basic amenities, whenever an amenity was not or only partially available, main barriers impeding availability were recoded. Similarly questions on building and equipment conditions, functionality and accessibility gather information on the underlying causes for non or partially operating health facilities.

Donut chart
Each donut chart indicates the percentage of health facilities having reported a given barrier. It is important to note that these charts exclude health facilities where the indicator is fully available. The total number of health facilities reporting at least one barrier is shown below the chart header.

Bar chart
Bar charts depicting barriers follow the same logic as donut charts and exclude health facilities where the indicator was fully available. The number of health facilities reporting at least one barrier is displayed below the region’s name.

Basic amenity types
For some basic amenities additional information on main sources or types of amenities available to health facility were collected. Alike barriers, types of amenities were only evaluated if the amenity was at least partially available.

Donut chart
Each donut chart indicates the percentage of health facilities having reported a given amenity. It is important to note that these charts exclude health facilities where the indicator was not available. The total number of health facilities reporting at least one amenity is shown below the chart header.

Bar chart
Bar charts depicting basic amenities follow the same logic as donut charts and exclude health facilities where the indicator was not available. The number of health facilities reporting at least one amenity is displayed below the region’s name.

Important: The denominators for charts depicting barriers and basic amenities exclude health facilities where the indicator was fully respectively not available. It should further be noted that health facilities could report up to three barriers and amenity types. Hence, the sum of all barriers respectively amenities reported may exceed 100%.
OVERVIEW OF HEALTH FACILITIES EVALUATED

Data completeness and recentness

Summary of health facilities evaluated

4238 Health facilities targeted

Not reporting, Planned, Partially operational, Operational
Operational Status of the Health System

Operational health facilities by province\(^a\)^\(^b\)

- Includes fully and partially operational primary health facilities (BHC, CHC, SHC, FHH, MHT, and FATP).

Operational hospitals by province\(^c\)^\(^d\)

- Includes fully and partially functional secondary and tertiary health facilities (NH, RH, PH and DH).

---

9. Includes fully and partially operational primary health facilities (BHC, CHC, SHC, FHH, MHT, and FATP).
11. Recommended minimum coverage: one district or rural hospital per 250,000 people (source: SPHERE handbook https://handbook.spherestandards.org/en/sphere/#ch009 [accessed: 2023-01-20])

---

The report provides a detailed analysis of accessibility in Afghanistan, highlighting the main causes of inaccessibility by region, with a focus on physical barriers, financial constraints, and other factors. The data also includes a regional breakdown of accessible, partially accessible, and inaccessible health facilities, offering insights into the challenges faced in different parts of the country.
Accessibility by health facility type

- National Hospital (n=29): 97% (Fully accessible), 3% (Partially accessible), 0% (Not accessible)
- Regional Hospital (n=14): 100% (Fully accessible), 0% (Partially accessible), 0% (Not accessible)
- Provincial Hospital (n=28): 100% (Fully accessible), 0% (Partially accessible), 0% (Not accessible)
- District Hospital (n=95): 97% (Fully accessible), 3% (Partially accessible), 0% (Not accessible)
- CHC (n=441): 95% (Fully accessible), 5% (Partially accessible), 0% (Not accessible)
- BHC (n=980): 96% (Fully accessible), 4% (Partially accessible), 0% (Not accessible)
- Sub Health Center (n=1231): 99% (Fully accessible), 1% (Partially accessible), 0% (Not accessible)

Sanitation facilities are considered available if the health facility has sufficient improved and usable sanitation facilities with at least one toilet reserved for staff, at least one sex-separated toilet with facilities for menstrual hygiene, and at least one toilet accessible to users with reduced mobility.
### Types of sanitation facilities

**Main types of sanitation facilities available (n = 3545)**

- **Flush/pour-flush toilet to sewer system/septic tank**: 36%
- **Flush/pour-flush toilet without water**: 24%
- **Uncovered pit latrine**: 23%
- **Covered Pit latrine or VIP**: 22%
- **Composting toilet**: 15%
- **Other**: 15%
