

A.42	Somatropin – hypoglycaemia secondary to growth hormone deficiency (GHD) – EMLc
<p><b>Draft recommendation</b></p>	<p><input type="checkbox"/> Recommended</p> <p><input checked="" type="checkbox"/> Not recommended</p> <p>Justification:</p> <p>Even when neonatal hypoglycemia can lead to severe neurological sequela, I do not think this is a medication that meets the criteria of “public health need”.</p> <p>In many areas of the world, the diagnosis of GHD is hard or even impossible.</p> <p>Additionally, this medication is expensive while there are multiple requirements for its the appropriate administration and appropriate use (requires refrigeration, injectable, etc).</p>
<p>Does the proposed medicine address a relevant public health need?</p>	<p><input type="checkbox"/> Yes</p> <p><input checked="" type="checkbox"/> No</p> <p><input type="checkbox"/> Not applicable</p> <p>Comments:</p> <p>The minimum prevalence rate of idiopathic GH deficiency in the USA and UK is between 1 in 3,400 and 4,000. It can be divided into congenital and acquired forms. There doesn’t seem to be information available about the incidence or prevalence of the congenital form specifically.</p> <p>Even when the congenital form can present as hypoglycemia and persistent jaundice, the single most important clinical manifestation of GHD is growth failure (for both forms). Children who are diagnosed very early in life often suffer from a congenital disorder, such as anatomical defects in the hypothalamic-pituitary region.</p> <p>Hypoglycemia becomes more common and severe when GHD is combined with deficiency of adrenocorticotrophic hormone.</p>
<p>Does adequate evidence exist for the efficacy/effectiveness of the medicine for the proposed indication?</p> <p>(this may be evidence included in the application, and/or additional evidence identified during the review process)</p>	<p><input type="checkbox"/> Yes</p> <p><input checked="" type="checkbox"/> No</p> <p><input type="checkbox"/> Not applicable</p> <p>Comments:</p> <p>Application reports that since it is ethically unreasonable to not treat patients diagnosed with GHD, there is a lack of RCTs trials to compare the effectiveness of rhGH therapy on hypoglycemia in neonates. However, clinical experience demonstrates that hypoglycemia in neonates and infants with GHD responds very well to rhGH. It is a correction of a deficiency.</p>
<p>Does adequate evidence exist for the safety/harms associated with the proposed medicine?</p> <p>(this may be evidence included in the application, and/or additional evidence identified during the review process)</p>	<p><input type="checkbox"/> Yes</p> <p><input checked="" type="checkbox"/> No</p> <p><input type="checkbox"/> Not applicable</p> <p>Comments:</p> <p>Reports are based on the use of rGH in older population since there is not much information available in children &lt;2y. Side effects reported in older patient do not seem to be concerning in newborns and infants.</p>

24<sup>th</sup> WHO Expert Committee on Selection and Use of Essential Medicines  
Expert review

<p>Are there any adverse effects of concern, or that may require special monitoring?</p>	<p><input type="checkbox"/> Yes  <input checked="" type="checkbox"/> No  <input type="checkbox"/> Not applicable  Comments:</p>
<p>Are there any special requirements for the safe, effective, and appropriate use of the medicines?   (e.g. laboratory diagnostic and/or monitoring tests, specialized training for health providers, etc)</p>	<p><input checked="" type="checkbox"/> Yes  <input type="checkbox"/> No  <input type="checkbox"/> Not applicable  Comments:  Patients need to be managed by a pediatric endocrinologist (ideal)  Patients required monitoring including physical examination and monitoring of other hormones</p>
<p>Are there any issues regarding cost, cost-effectiveness, affordability and/or access for the medicine in different settings?</p>	<p><input checked="" type="checkbox"/> Yes  <input type="checkbox"/> No  <input type="checkbox"/> Not applicable  Comments:  There is no data on cost-effectiveness of rhGH treatment in neonates and infants with hypoglycemia.  It is readily available in all high-income countries and are usually covered by the government/ insurance for GHD. In LMICs, it is not readily available and is rarely funded by the health authorities.</p>
<p>Are there any issues regarding the registration of the medicine by national regulatory authorities?   (e.g. accelerated approval, lack of regulatory approval, off-label indication)</p>	<p><input type="checkbox"/> Yes  <input checked="" type="checkbox"/> No  <input type="checkbox"/> Not applicable  Comments:</p>
<p>Is the proposed medicine recommended for use in a current WHO guideline?   (refer to:  <a href="https://www.who.int/publications/who-guidelines">https://www.who.int/publications/who-guidelines</a>)</p>	<p><input type="checkbox"/> Yes  <input checked="" type="checkbox"/> No  <input type="checkbox"/> Not applicable  Comments:</p>
