A.43	Sunscreen – prevention of skin cancer in people with albinism, xeroderma	
pigmentosum – EML and EMLc		
Draft recommendation		 ☑ Recommended ☐ Not recommended Justification: Patients with albinism and xeroderma pigmentosa have deficient melanin pigment. They are therefore highly vulnerable to ultraviolet (UV) radiation and are at high risk of developing skin cancers due to the chronic effects of UV radiation on their skin. It is essential that preventive measures be in place to prevent the development of these cancers. Sunscreens are the only preventive measure available at present.
Does the proposed medicine address a relevant public health need?		 ⋉ Yes □ No □ Not applicable Comments:
Does adequate evidence exist for the efficacy/effectiveness of the medicine for the proposed indication? (this may be evidence included in the application, and/or additional evidence identified during the review process)		 ✓ Yes ☐ No ☐ Not applicable Comments:
