Dear Colleague,

It is our pleasure to invite you to a webinar organised by the World Health Organization (WHO), the ATLAS Project and STAR Initiative, in partnership with Unitaid on HIV self-testing secondary distribution.

HIV self-testing (HIVST) is an innovation that has the potential to reach priority populations not yet tested. HIVST kits can be distributed through various channels. Secondary distribution of HIV self-test kits by individuals through their networks (peers, partners, clients, etc.), can be particularly useful for reaching populations unable to access other testing services. Studies have shown that secondary distribution of HIV self-test kits by women attending antenatal clinics to their male sexual partners, or by key populations to their sexual partners and peers, increases uptake of testing services among these difficult to reach populations.

Register now for this webinar on 21 June 2022.
This 90-minute webinar will address HIVST secondary distribution, based on WHO guidance and lessons learned from the ATLAS and STAR Initiative projects in sub-Saharan Africa.

This session will include presentations on:

- WHO guidance on HIVST secondary distribution
- Lessons learned from the ATLAS and STAR Initiative projects
- Country experiences from Cameroon and Côte d'Ivoire

The webinar will be in English with simultaneous interpretation into French.
