CORRIGENDUM (14 August 2023)

Consolidated guidelines on person-centred HIV strategic information: strengthening routine data for impact. Web Annex G. Sampling, abstraction and reporting guidance for early warning indicators of HIV drug resistance

WHO/UCN/HHS/SIA/2022.11

Page 6, Fig. G2, footnote b

Delete: While results for AV.2 and AV.11 are representative of the clinic sampled, the VL suppression indicator reflects only those who had a VL test result. In this example only 50% of eligible patients had a VL test result; thus, the prevalence of VL suppression cannot be generalized to the entire eligible population and this indicator (AV.3) is reported in grey. In the case of the VL suppression indicator, the proportion of available data during the reporting period is captured and reported as VL testing coverage (AV.6). For all other EWIs, if ≥30% of data are unavailable, a grey score is assigned, and no prevalence estimate is reported.

Insert: While results for ART.2 are representative of the clinic sampled, the VL suppression indicator reflects only those who had a VL test result. In this example only 50% of eligible patients had a VL test result; thus, the prevalence of VL suppression cannot be generalized to the entire eligible population and this indicator (ART.3) is reported in grey. In the case of the VL suppression indicator, the proportion of available data during the reporting period is captured and reported as VL testing coverage (ART.6). For all other EWIs, if ≥30% of data are unavailable, a grey score is assigned, and no prevalence estimate is reported.
