Iakwe.

On behalf of Honorable Kalani R. Kaneko, Minister of Health & Human Services, and all members of the Senior Leadership Team, we acknowledge all project partners and all who supported the RMI Hybrid Survey. We acknowledge the tremendous effort in the planning, coordination, implementation and data validation to ensure that the Hybrid Survey provides valuable information for relevant and timely implementation of interventions to prevent and control non-communicable diseases affecting all the people of the Republic of the Marshall Islands.

Project RMI Partners including MIEPI, EPPSO, KUMIT, Department of Interior, Mayors and council men/women from MALGOV, JALGOV, Wotje local government, KBE local government, Arno local government, KALGOV, Alaps and other traditional leaders from Majuro, Arno, Ebeye, Wotje, Kili, Jaluit, School and Churches for survey sites, Taiwan Health Center, and Hybrid Surveyors

Project External Partners including Centers for Disease Control and Prevention (CDC)- Stacy De Jesus, Pacific Islands Team Lead, World Health Organization- Dr. Wendy Snowdon, Team Coordinator-Pacific NCD and Health through the Life-Course, Pacific Island Health Officers’ Association Dr. Haley Cash, Regional USAPI Epidemiologist and Emi Chutaro, Executive Director, Association of State and Territorial Health Officials -Leah Silva, JD, Director, State and Territorial Performance Improvement, University of Hawaii, Children’s Healthy Living Program (CHL) Dr. Rachel Novotny, Interim Dean of CTAHR, CHL Principal Investigator, Professor, Graduate Chair, Nutrition PhD Program Dr. Marie Kainoa Fialkowski Revilla, Dietetics Program Director & Assistant Professor in Human Nutrition.

The survey results paint a clear picture of the current core risk factors for non-communicable diseases and one most obvious of the risk factors is that 73% of adults in the Marshall Islands are overweight or obese, that only 5% of adults consume 5 or more servings of fruits and vegetables per day. The survey revealed that 77% of adults DO NOT SMOKE cigarettes, however 23% of smoke cigarettes, 87% DO NOT CHEW BETELNUT however 13% chew betelnut with tobacco and that has increased from 1.8% in 2002. The survey also shows that 27% of adults have diabetes and 21% of adults have high blood pressure and more important to note is that 65% and 68% of the people respectively, go undiagnosed. When it comes to cancer screening, the survey found that 66% of women (age 21-65 yo) do not meet the USPTF guidelines for pap smear or VIA every three years, and that 78% of women (age 50-74 yo) do not meet the USPTF guidelines for mammogram every 2 years and 52% of RMI adults have NOT had a medical checkup in the past year.

The prevalence of NCD risk factors in the Marshall Islands is quite high and seems to indicate that there has been none to very little improvement since the 2002 WHO STEPs Survey. The Ministry of Health & Human Services is in full agreement that every effort must increase to address core risk factors at individual, community and national level. We need everybody’s help.

Thank you for all you do.

Julia M. Alfred
Secretary of Health & Human Services
Summary

The aim of this report is to assess the current prevalence of non-communicable diseases (NCDs) and selected risk factors in The Republic of Marshall Islands (RMI). We hope this report enables RMI to better understand its burden of disease, monitor trends, and determine who is at greatest risk for poor health in order to improve health through the development of targeted evidence-based interventions.

Non-Communicable Diseases (NCDs) such as heart disease, cancer, and diabetes are global issues that result in high burdens of disability and premature death. NCDs, substance use, and poor mental health are highly linked to several key risk factors, such as cigarette smoking, tobacco chewing, excessive alcohol consumption, unhealthy diet, lack of physical activity, and overweight/obesity. Diabetes is a major concern in RMI, although the outdated data previously available may not support that. The hospital is overburdened with diabetes patients, often presenting at late stages and requiring amputation and dialysis (not available in-country). The outer islands present a challenge for healthcare delivery and data collection, especially for NCDs. A lot of resources are used for late-stage diabetes treatment. Nutrition is a real challenge due to limited land and very little food produced locally. There is a significant reliance on imported foods that are often processed, nutrient poor, and calorie dense. Although NCDs are a priority in RMI, other health issues should not be overlooked, to include maternal-child health issues, child malnutrition, sexually transmitted infections, mental health, and infectious disease.

The Republic of the Marshall Islands undertook a novel population-based household survey that combined NCD and associated risk factor indicators and substance use from July 2017 – April 2018. A total of 2,869 individuals aged 18 years or older participated in the survey from the islands of Majuro, Kwajalein, Arno, Jaluit, Wotje, and Kili. Although all islands were not surveyed, the islands included make up 83% of the overall population of RMI. Respondents answered questions about their alcohol and tobacco use, other substance use, dietary habits, physical activity, health access, oral health, health conditions, and cancer screening. Additionally, height and weight, fasting blood glucose, total cholesterol, and blood pressure were measured.
**RMI vs. USA**

Here are RMI’s 2018 Hybrid Survey prevalence data compared to U.S. prevalence data using the most comparable sources available.

*Smokeless tobacco use in RMI is defined as use of smokeless tobacco and/or chewing betel nut with tobacco.

**Diabetes prevalence is estimated based on either a self-report of diabetes for which the patient is taking medication and/or a single fasting blood sugar of 126mg/dL during the survey; Hypertension prevalence is estimated based on either a self-report of hypertension for which the patient is taking medication and/or a measured average blood pressure (of 3 readings) of ≥140/90.

Surveillance in RMI:

The table below compares the 2002 RMI STEPS prevalence data to the 2018 RMI Hybrid prevalence data using the most comparable data available. Note that the 2002 RMI STEPS data include ages 15-64, whereas the 2018 RMI Hybrid data include ages 18+, therefore these prevalence data are not directly comparable, but still allow us to estimate trends.

Introduction

Non-communicable diseases (NCDs) are the leading causes of morbidity and mortality for adults in the United States Affiliated Pacific Islands (USAPIs) (American Samoa, Guam, Commonwealth of the Northern Mariana Islands [CNMI], Federated States of Micronesia [FSM], Republic of Palau, and Republic of Marshall Islands [RMI]) [1].

On May 25, 2010 the Pacific Island Health Officers Association (PIHOA) declared a Regional State of Health Emergency due to the epidemic of non-communicable diseases in the USAPI due to the fact that NCDs account for around 70-75% of all deaths in the region [2]. The NCDs of concern in the USAPIs include diabetes, heart disease, stroke, cancer, and chronic obstructive pulmonary disease [2,3]. Risk factors for developing NCDs within these island jurisdictions are among the highest in the world. This includes tobacco use, poor diet, sedentary lifestyles, and binge drinking [2]. In most of the USAPI, betel nut (which is carcinogenic to human) chewing with or without tobacco is also identified as a significant health problem [4].

Diabetes is a major concern in the RMI. The diabetes epidemic has been linked to lifestyle changes such as, increased dietary fat intake, reduced fiber intake, and reduced physical activity. Other factors such as socioeconomic status, degree of urbanization, and access to health care have also been shown to affect the prevalence of diabetes on these islands [5]. Hospitals are overburdened with diabetes patients, who often present at late stages, oftentimes requiring amputation and dialysis.

Key components of PIHOA’s response to the NCD crisis include strengthening NCD surveillance systems and building epidemiologic capacity to improve data quality and reporting in the USAPIs. The last NCD adult population-based survey in RMI was conducted in 2002. Due to the need for current NCD and risk factor prevalence data, the Marshall Islands Epidemiology Prevention Initiative (MIEPI), a local NGO, and the RMI Ministry of Health combined efforts to develop and implement an adult population-based Hybrid survey. Other support was provided by PIHOA, the Centers for Disease Control and Prevention (CDC), the World Health Organization (WHO), the Association of State and Territorial Health Officials (ASTHO), and the Pacific Community (SPC). The Hybrid survey was developed to assess NCD risk factors and NCD conditions through self-diagnosis, as well as physical and biochemical measurements.
The Republic of the Marshall Islands (RMI) is comprised of 24 coral atolls, with a total of 1,156 individual islands and islets located in the North Pacific Ocean. The major district centers are Majuro, Ebeye, Wotje, and Jaluit. The islands are made up of coral caps set on the rims of submerged volcanoes. RMI has a total land area of 70 square miles that are scattered over the country’s Exclusive Economic Zone of over 750,000 square miles [6].

The Republic of Marshall Islands has been a sovereign nation since 1986 with a Compact of Free Association with the U.S. Majuro is the capital and largest city of RMI. Majuro and Kwajalein are accessible by international airlines. Flights between these islands and 26 other outer islands are also available through Air Marshall Islands airlines. [6]. The population of RMI is 52,158 (2011 Census). A majority of the population (74%) resides on Majuro and Kwajalein atolls. The population density on these two atolls is quite high. Majuro has a total land mass of 3.75 square miles with a population of 27,797 (7,413 people/m$^2$). Kwajalein is comprised of 97 islands and islets and has a land area of 6.33 square miles [7]. Ebeye, an island on Kwajalein atoll is the most populous with 9,614 people on 0.12 square miles (80,117 people/m$^2$). Although the fertility rate in RMI is quite high, the population is decreasing due to out migration.

Accessibility to healthcare for the residents of RMI is mixed. While private clinics are available, the majority of RMI residents use the public healthcare system. There are two hospitals, one in Majuro and one in Ebeye. There are 56 outer island health centers managed by the hospital in Majuro by the Office of Outer Islands. Information from these offices are communicated to the Majuro Hospital via radio. Lastly, there are 5 outer island health centers that are managed by the 177 healthcare program for victims of nuclear fallout. The 177 healthcare program is a U.S. federal grant that supports U.S. doctors to manage these health centers.
The RMI Hybrid Survey aimed to assess the prevalence of selected NCDs, risk factors, and substance use, which includes questions from validated instruments such as the Behavioral Risk Factor Surveillance System (BRFSS), STEPwise approach to Surveillance (STEPS), and National Health and Nutritional Examination Survey (NHANES), as well as locally developed questions as needed.

**Objectives**

1. Inform the community on NCD and risk factor prevalence
2. Use these data to prioritize and tailor NCD prevention programs
3. Support further research on NCD risk and protective factors in RMI
4. Use these data to monitor progress in the fights against NCDs in RMI

**Target group**

Participants eligible for the RMI Hybrid survey will include all RMI residents aged 18 years and over residing in Majuro, Kwajalein, Arno, Jaluit, Wotje, and Kili who were able to comprehend either English or Marshallese and provide consent.

**Data collection**

Data collection began on July 7, 2017 and ended on April 5, 2018. A total of 2,869 respondents completed the survey and measurements. All interviews and measurements were performed by trained surveyors recruited by the Marshall Islands Epidemiology Prevention Initiative (MIEPI).
**Sample size**
The original sample included 3107 adults. Sample size was determined based on overall adult populations on selected islands in the Republic of the Marshall Islands. (Majuro = 1659; Ebeye = 627; Kili = 200; Wotje = 207; Jaluit = 207; Arno = 207). The final response rate was 92.3%.

**Sampling procedures**
Stage 1: Households were identified at random according to geographical stratification in Majuro and Ebeye. The country was stratified into two major groups, Urban (Majuro and Ebeye) and Rural (all outer islands). In Majuro and Ebeye, household cluster sampling was used to randomly select households in these areas.
Stage 2: In Majuro and Ebeye, one individual was selected at random from each household using the KISH table method. All adults in Kili, Arno, Wotje, and Jabwor, Jaluit atolls were included in the sample because the adult populations are about 200 each on these atolls.

**Data collection**
Surveys were translated and available in Marshallese and English. Data were collected by trained surveyors using face-to-face questionnaires followed by physical and biochemical measurements conducted at central locations the following morning for fasting measurements. Quality control of completed questionnaires was ensured at different stages during the questionnaire-processing phase.

**Data entry**
All data were collected electronically using a tablet. Tablets were uploaded on a weekly basis at the MIEPI Office.

A data dictionary was created to explain the indicators and data codes.

**Data cleaning**
Descriptive statistics were produced for all variables. Values that did not match the data codes defined in the data dictionary were verified against the original questionnaire and rectified. Outliers were also checked, validated, and rectified.

**Data analysis**
Descriptive data analysis was conducted. Chi-squared analysis was used to analyzed differences by:
- **age group** (18-24 years old, 25-34 yo, 35-44 yo, 45-55 yo, 55-64 yo, 65+ yo)
- **gender** (male, female)
- **location** (Majuro, Kwajalein, and other Outer Atolls)
- **education** (high school education or less, more than high school education)

[The decision was made to not weight these data due to low non-response and lack of recent census data to develop weights.]
Sample Summary

The sample randomly selected to participate in the Republic of the Marshall Islands (RMI) Hybrid Survey appears to be representative of the total population in RMI. The demographic distributions of the 2011 Census are relatively similar to the distributions of the survey sample demographics. Note that the most recent Census data available are seven years old therefore may not be completely accurate.

* Census data reported for all ages
About one-third of adults in RMI (31.6%) self-reported their general health to be fair or poor.

When we examine self-report of fair or poor health by demographics, we find females self-report worse health than men, people with more education self-report worse health than people with less education, self-report of worse health increases with age, and adults in in the Outer Atolls report the highest prevalence of fair or poor health.
Overall, over half (51.5%) of adults in RMI did not receive an annual checkup in the past year, and two out of five (37.9%) adults have never had an annual checkup.

Younger adults, less educated adults, and adults living in Majuro and the Outer Atolls were less likely to have had their annual exams.
Oral Health

Two out of every five adults in RMI (38.5%) had a dental visit in the past year. One out of three adults (33.7%) in RMI have never seen a dentist. About four out of every five (79.9%) adults in RMI have had at least one tooth removed due to tooth decay or gum disease.

![Last Dental Exam among Adults in RMI, 2018](chart1)

![Number of Permanent Teeth Removed due to Tooth Decay or Gum Disease among Adults in RMI, 2018](chart2)
Overweight/Obesity

Body Mass Index (BMI) is calculated based on height and weight measurements. Based on these measurements, almost three out of every four (72.5%) adults in RMI are overweight or obese.

Women and middle age groups have the highest prevalence of overweight/obesity.
Hypertension

One out of every five adults (21%) in RMI had high blood pressure (≥140/90) during screening or self-reported having hypertension* for which they took medication.

* Hypertension prevalence is estimated based on either a self-report of hypertension for which the patient is taking medication and/or a measured average blood pressure (of 3 readings) of ≥140/90.

Hypertension prevalence increases with age, with about half (53.7%) of adults 65 and older having hypertension. Hypertension prevalence was slightly higher in men. Additionally, hypertension prevalence was higher for less educated adults, and lowest in Majuro.

**Hypertension, by gender**

- Male: 22.4%
- Female: 19.7%

**Hypertension, by age**

- 18-24: 4.7%
- 25-34: 11.3%
- 35-44: 18.5%
- 45-54: 31.7%
- 55-64: 40.8%
- 65+: 53.7%

**Hypertension, by education**

- Highschool or less: 21.5%
- More than High School: 18.8%

**Hypertension, by atoll**

- Majuro: 19%
- Kwajalein: 22%
- Outer Atolls: 23.1%
21% of the adult population in RMI is estimated to have hypertension. Among those adults in RMI estimated to have hypertension, over two-thirds (68.3%) are undiagnosed.

Among those adults who are diagnosed and taking medication, about half (49.2%) remain uncontrolled (average blood pressure [of 3 measurements] during survey was ≥140/90).
Diabetes

26.8% of adults had measured high fasting blood sugar (≥126mg/dL) or self-reported having diabetes* for which they were taking medication.

*Diabetes prevalence is estimated based on either a self-report of diabetes for which the patient is taking medication and/or a single fasting blood sugar of 126mg/dL during the survey. Pre-diabetes is estimated based on either a self-report of pre-diabetes and/or a single fasting blood sugar of 100-125 mg/dL during the survey.

Diabetes prevalence increases with age, with a prevalence of 53.7% among those 65 and older. In addition, there is a higher prevalence of diabetes among women, less educated adults, and adults living in Majuro.
26.8% of the adult population in RMI is estimated to have diabetes. Among those adults estimated to have diabetes, about two-thirds (65.3%) are undiagnosed.

Among those adults in RMI who are diagnosed and taking medication for diabetes, the majority of them (83.7%) remain uncontrolled (fasting blood sugar was 126mg/dL or higher during survey).
Among adults with who self-reported having diabetes in RMI, about one in three adults (36.5%) have not seen a health professional for their diabetes in the past year.

About two out of every five (42.1%) adults with self-reported diabetes in RMI did not check their blood sugar levels in the past year. 67.5% of adults in RMI with self-reported diabetes have not had their HbA1c check by a health professional in the past year.
Diabetes Management

Among adults who self-reported as having diabetes in RMI, 63.4% have never checked their feet for sores or irritations; 69.4% have not had a health professional check their feet for any sores or irritations in the past year.

Among adults who self-reported as having diabetes in RMI, about half (53.2%) had never had an eye exam in which their pupils were dilated; 81.1% have not ever taken a course or class on how to manage diabetes themselves.
Almost one out of every five adults (18.8%) in RMI had “elevated” total cholesterol (≥190mg/dL) during screening. However, only 4.9% had “high” total cholesterol (≥240mg/dL).

Elevated total cholesterol prevalence was highest among women, older adults, and residents of the Outer Atolls.
Self-Reported Chronic Disease

Self-reported chronic disease is organized below by most prevalent to least.

</table>
Cigarette Smoking

About one out of five (22.5%) adults in RMI reported cigarette smoking in the last 30 days. A majority of these adults (83.1%) smoke every day. Over half (57.4%) of these smokers reported that they want to quit. The average age adults started smoking among every day smokers in RMI was 19 years old.

Smoking prevalence was highest among men, young adults, and adults living in the Outer Atolls.

---

**Smoking Status among Adults in RMI, 2018**

- **Non-smoker**: 77.4%
- **Some day smoker**: 3.8%
- **Every day smoker**: 18.7%

---

**Smoking Status, by gender**

- Male: 43.3%
- Female: 4.1%

---

**Smoking Status, by age**

- 18-24: 25.6%
- 25-34: 26.6%
- 35-44: 23.8%
- 45-54: 20.3%
- 55-64: 15.6%
- 65+: 8.7%

---

**Smoking Status, by education**

- Highschool or less: 22.7%
- More than High School: 21.9%

---

**Smoking Status, by atoll**

- Majuro: 20.5%
- Kwajalein: 23.1%
- Outer Atolls: 25.1%
E-Cigarette Use

5.5% of adults in RMI reported use of e-cigarettes in the past 30 days, and 68.6% of these adults were every day users.

Although e-cigarette use prevalence is relatively low in RMI compared to cigarette smoking, it appears that men, young adults, more educated, and adults living in Majuro are taking up this habit.

E-cigarette Use among Adults in RMI, 2018

E-cigarette Use, by gender

E-cigarette Use, by age

E-cigarette Use, by education

E-cigarette Use, by atoll
About one-third (31.6%) of all adults in RMI reported some sort of exposure to second-hand smoke (SHS) at home, in a vehicle, or at work in the past 7 days. The most common place of second-hand smoke exposure was in a vehicle (20.1%). 10.3% of adults reported second-hand smoke exposure at work and 15.4% of adults reported second-hand smoke exposure at home.
Betel Nut Use

13.8% of adults in RMI reported betel nut use in the past 30 days. Over half (57.8%) of adults who chew betel nut, chew every day. A majority of respondents (96.5%) who use betel nut add tobacco. About 75% of respondents who used betel nut said they wanted to quit.

Betel nut chewing is most prevalent among men, young adults, those with a higher education, and adults living in Majuro.
Overall Tobacco Use

Over one-third (37.8%) of adults in RMI reported using any form of tobacco (smoke, chewing tobacco, or chewing betel nut with added tobacco).

Tobacco use was more prevalent among men, young adults, more educated individuals, and those living in Kwajalein.
Alcohol Use and Binge Drinking

16.3% of adults in RMI reported alcohol use in the past 30 days. Only 0.8% of adults reported drinking alcohol every day in the past 30 days. 14.8% of adults reported binge drinking* in the past 30 days. The average age that adults start drinking among those who drank in the past 30 days in RMI was 20 years old.

*(binge drinking is defined as drinking 4 or more standard drinks on one occasion for women and 5 or more standard drinks on one occasion for men)

Binge drinking is more prevalent among men and more educated adults. Additionally, binge drinking is most prevalent in Kwajalein.
Regular Diet

Over one-third of adults in RMI (37.4%) reported eating a majority imported food or all or mostly all imported food. Another third of adults (37.4%) reported eating about half local food and half imported food. It was estimated that only 6.5% of adults in RMI eat all or mostly all local food.

A diet consisting of a majority of imported food was more prevalent among younger adults, more educated adults, and those living in Kwajalein.
Fruit and Vegetable Consumption

A majority of adults in RMI (94.5%) consume less than the recommended daily servings of fruits and vegetables (at least 5 per day), and about half (48.8%) consume <1 serving of fruits and vegetables daily.

Very low fruit and vegetable consumption (<1 serving per day) was more prevalent among younger adults, less educated individuals, and those living in the outer atolls.
Sodium

81.8% of adults in RMI say they are currently watching their salt intake. Over half (61.7%) of adults in RMI feel that lowering their dietary salt intake is very important.

Self-reported Importance of Lowering Dietary Salt among Adults in RMI, 2018

- Very Important: 61.7%
- Somewhat Important: 27.6%
- Not at all Important: 10.6%
Most adults in RMI (92.6%) consume processed meat (defined as packaged or canned modified meat products such as spam, hotdogs, vienna sausages, etc.) at least once per day.

Heavy consumption of processed meats (2+ times per day) is more prevalent among men and younger adults. Majuro has the highest prevalence of heavy consumption of processed meats (71.6%), followed by Kwajalein (61.9%), and the Outer Atolls (53.8%).
Sugar-Sweetened Beverages

Most adults (89.2%) in RMI consume at least one serving of a sugar-sweetened beverage (SSB) each day. Over half (54.6%) consume 2 or more servings of SSBs daily.

Heavy consumption of SSBs (2+ SSB servings daily) is most prevalent among less educated adults, and those living in the outer atolls.
Physical Activity

In RMI, about one-third (29.5%) of adults did not engage in any physical activity specifically for exercise in the past month. Less than half (43.5%) participated in physical activity for exercise every day in the past 30 days.

No physical activity specifically for exercise is most prevalent among women, older adults, less educated adults, and those living in Kwajalein.
Among adults who were physically active, specifically for exercise in the past 30 days in RMI, walking was the most prevalent form of physical activity done for exercise (60.7%). In addition, 26.5% of adults in RMI play sports to stay physically active.

Among adults in RMI who play sports, the most common sports reported were basketball (35.6%) and volleyball (27.3%).
Colon Cancer Screening: Colonoscopy

Most adults 50 to 75 years old in RMI (92%) have never received a colonoscopy. Only 7.9% of adults 50 to 75 years meet the American Cancer Society recommendation of receiving a colonoscopy every 10 years.

The recommendation for receiving a colonoscopy is met more by women, older adults, more educated adults and those living in Kwajalein.
Colon Cancer Screening: Blood Stool Test

Over half (59.6%) of adults in RMI have never received a Blood Stool Test. About 1 in 5 adults (22.7%) 50-75 years old in RMI meet the American Cancer Society recommendation of receiving a Blood Stool Test once per year.

Kwajalein had the highest prevalence (34.6%) of adults meeting the recommendation of receiving a blood stool test every year.

Blood Stool Test in past year, by gender

Blood Stool Test in past year, by age

Blood Stool Test in past year, by education

Blood Stool Test in past year, by atoll
Female Cancer Screening: Mammogram

About 1 in 5 women (22%) aged 50-74 years in RMI have received a mammogram in the past two years per US Prevention Task Force (USPTF) recommendation; 70.6% have never received a mammogram.

The recommendation for receiving a mammogram is met more by more educated women, women 50-54 years old, and those living in Kwajalein.
Female Cancer Screening: Pap/VIA

About 1 in 3 women (33.6%) aged 21-65 years in RMI have had a Pap Smear or Vaginal Inspection with Acetic Acid (VIA) in the past 3 years (per USPTF recommendation); Over half (54.2%) have never had a Pap Smear or VIA.

The recommendation for receiving a Pap or VIA is met more often by more educated women and women living in Kwajalein.
Female Cancer Screening: Clinical Breast Exam

About three out of four women (76.5%) have never had a clinical breast exam. There are currently no set recommendations for receiving a clinical breast exam.

Last Clinical Breast Exam (CBE) among Women in RMI, 2018

- 76.5% Never
- 14.6% within past year
- 4.1% within past two years
- 1% within past three years
- 1.3% within past five years
- 2.5% five or more years
Important notes about survey

Limitations:

- A good portion of the data collected are self-reported, thus bias may exist.
- Not all of the outer atolls could be surveyed, therefore these data do not represent all of the RMI. However, the majority of the population (83%) was eligible for sampling, and some of the outer atolls (Arno, Jaluit, Wotje, and Kili) were sampled to reflect all outer atolls.

Strengths:

- Physical and biochemical measurements were conducted for NCD prevalence estimation rather than just self-report.
- Sample size was exceptionally large and included approximately 10% of all adults residing in RMI.
- Quality and thorough training provided for all surveyors and partners (including standardization of anthropometric measures - height and weight).
- Use of tablets ensured data collection was clean, efficient, and timely.
- There were successful partnerships and collaboration between internal and external stakeholders.
- The majority of the randomly selected participants were agreeable to taking part in the survey, resulting in a high response rate of 92.3%.
- To ensure quality and authentic collection of data, surveyors were required to take photos of selected participant, participant’s home, and attain signatures from participants each time a section of the survey was completed (participants were informed photos would not be used publicly but only seen by survey managers for auditing purposes only).

Challenges:

- The original methodology requested that after the interview, participants fast that evening and show up at designated locations nearby the following day for fasting measurements. Unfortunately, participant turn-out was low using this methodology. Therefore, a slight adjustment to survey methodology was initiated three months into collection, in which surveyors came back to the participant’s home for fasted measurements.
- Securing funds and lengthy processes for procurement caused survey delays.
- There were about 44 trained surveyors. Within three months, more than half of the surveyors were lost to various factors like full time jobs, school, and travel. A handful of surveyors who were not following proper protocol of data collection also had their contracts terminated. In the end, there were only about 10 reliable surveyors.
- For Majuro and Ebeye (urban centers), it was a challenge to find selected participants who had a full-time job or who were attending school. Surveyors found it difficult to find them at home during the day and during revisits in the evening. Multiple house visits were therefore necessary.
- Participants occasionally forget to fast for the biochemical measurement portion of the survey, therefore surveyors were obligated to reschedule visits.
Recommendations

As previously mentioned, non-communicable diseases are the leading causes of morbidity and mortality in the U.S. Affiliated Pacific Islands, which includes the RMI [1]. Based on the results found, it is apparent that many RMI residents are currently suffering from various NCDs and their lifestyle may be contributing to these morbidities. Overweight/obesity, tobacco use, and poor diet have been identified as prevalent risk factors for developing NCDs in the RMI. Evidence-based programs and policies targeting adults as well as youth may be particularly effective in reducing the prevalence of NCDs in the RMI.

High prevalence of NCDs, specifically diabetes is apparent. Additionally, there appear to be many individuals with undiagnosed NCDs in the population. Among those diagnosed with diabetes or hypertension, control of these conditions appears to be poor. Programs that encourage individuals to seek professional care for screening and treatment of NCDs are recommended. Additionally, evidence-based self-management programs could be considered.

Prevalence of NCDs may also be impacted by limited medical resources in this small island nation such as lack of medical specialists, lack of appropriate equipment and technicians, and lack of laboratory testing supplies and capacity. This is especially true in the smaller outer islands. These limited resources may be contributing to the low prevalence of medical screenings, including mammograms, pap smear/VIA, and colonoscopies.

**Priority areas for health improvement in the RMI include:**

1. Reducing overweight and obesity by improving diet/nutrition education and healthy food access and increasing physical activity using evidence-based programs.
2. Strengthening NCD clinical screening and management programs among adults in RMI.
3. Providing appropriate cessation services for substance use, specifically tobacco and alcohol.
4. Consider policy approaches to reduce certain risk factors, especially those in the Monitoring Alliance for NCD Action (MANA) framework.
5. Support chronic disease self-management programs to help individuals with NCDs control their disease.

<th>Classifications used in this report</th>
</tr>
</thead>
</table>
| General Health            | Would you say that your general health is…                                                                                                                                                                   | The following responses were used:  
- Excellent  
- Very good  
- Good  
- Fair or okay  
- Poor or not good |
| Last doctor visit         | About how long has it been since you last visited a medical provider for an annual checkup? An annual checkup is a general physical exam, not an exam for a specific injury, illness, or condition. | The following responses were used:  
- Within past year  
- Within past 2 years  
- Within last 5 years  
- 5 or more years ago  
- Never |
| Last dental visit         | How long has it been since you last visited a dentist or a dental clinic for any reason? Include visits to dental specialists, such as orthodontists.                                                              | The following responses were used:  
- Within past year  
- Within past 2 years  
- Within last 5 years  
- 5 or more years ago  
- Never |
| Teeth missing             | How many of your permanent teeth have been removed because of tooth decay or gum disease? Include teeth lost to infection, but do not include teeth lost for other reasons, such as injury or orthodontics. | • 1 to 5  
• 6 or more but not all  
• All  
• None |
| Body Mass Index Category  | Measured height and weight were used.                                                                                                                                                                        | BMI is calculated by taking your weight (in kilograms) over your height squared (in centimeters).  
We used CDC categories:  
- Underweight <18.5  
- Normal 18.5-24.9  
- Overweight 25-29.9  
- Obese 30+ |
<p>| Hypertension              | Measured blood pressure and self-reported high blood pressure and medication status was used to categorize hypertension.                                                                                      | Individuals were categorized as having hypertension if their measured BP was ≥140/90 and/or if they self-reported being diagnosed with hypertension and were taking medication for their hypertension |
| High blood sugar or diabetes | Measured fasting blood glucose and self-reported diagnosis of diabetes and medication status was used to categorize high blood sugar/diabetes.                                                              | Individuals were categorized as having diabetes if their fasting blood glucose was ≥126mg/dL and/or if they self-reported being diagnosed |</p>

</table>
| Alcohol consumption                                                     | During the past 30 days, on how many days did you have at least one standard drink of any alcohol? | 0 days = non-drinker  
1-29 days = some days  
30 days = every day |
| Age first starting drinking alcohol                                      | How old were you when you first started drinking alcohol?                                     | Age _____ |
| Binge alcohol frequency                                                 | During the past 30 days, how many days did you have:  
- for men: Five or more standard alcoholic drinks?  
- for women: Four or more standard alcoholic drinks? | 0 days = no binge  
1-30 days = binge |
| Regular Diet                                                             | How much of your regular diet is made up of local/traditional foods (such as local fish, taro, breadfruit, banana, pandanus, etc.)? | The following responses were used:  
- Majority local food but some imported food  
- About half local and half imported food  
- Majority imported food but some local food  
- All or mostly all imported food |
| Fruit and vegetable consumption                                         | Some of usual daily fruit consumption and daily vegetable consumption | <1 servings  
1-<3 servings  
3-<5 servings  
5 or more servings |
| Watching salt intake                                                     | Most of the sodium or salt we eat comes from processed foods and foods prepared in restaurants. Salt also can be added in cooking or at the table. Are you currently watching or reducing your sodium or salt intake? | Yes or no |
| Importance of lowering salt in diet                                      | How important is lowering salt in your diet?                                                   | Very important  
Somewhat important  
Not at all important |
| Processed meat consumption                                              | In a typical day, how many times do you eat processed meats? This does not include canned fish. | 0 servings  
1 serving  
2 or more servings |
| Sugar-sweetened beverage consumption                                    | In a typical day, how many sugary drinks do you drink? This does not include diet drinks made with artificial sweeteners. | 0 servings  
1 serving  
2 or more servings |
| Physical Activity                                                       | During the past 30 days, other than your regular job, on how many days did you participate in any physical activities or exercises such as running, sports, walking, or going to the gym, specifically for exercise? | 0 = no physical activity  
1-29 days = some days  
30 days = every day |
| Type of Physical Activity                                               | What type of physical activity or exercise did you spend the most time doing during the past 30 days? | The following categories were used:  
- Walking  
- Sports  
- Other |
| **Hours spent per day sitting** | **How much time do you usually spend sitting or reclining on a regular day? (This does not include time spent sleeping)** | **The following categories were used:**  
  - <3 hours per day  
  - ≥3 hours per day |
|-----------------------------|-------------------------------------------------------------|------------------------------------------------------------------|
| **Colonoscopy Screening**   | **How long has it been since your last colonoscopy?**       | **The following responses were used for adults 50-75:**  
  - Never  
  - Within the past year  
  - Within the past 2 years  
  - Within the past 3 years  
  - Within the past 5 years  
  - Within the past 10 years  
  - 10 or more years ago |
| **Blood Stool Test**        | **How long has it been since you had your last blood stool test?** | **The following responses were used for adults 50-75:**  
  - Never  
  - Within the past year  
  - Within the past 2 years  
  - Within the past 3 years  
  - Within the past 5 years  
  - 5 or more years ago |
| **Mammogram screening**     | **How long has it been since you had your last mammogram?**  | **The following responses were used for those women 50-74:**  
  - Never  
  - Within the past year  
  - Within the past 2 years  
  - Within the past 3 years  
  - Within the past 5 years  
  - 5 or more years |
| **Clinical breast exam**    | **How long has it been since your last clinical breast exam?** | **The following responses were used for all women:**  
  - Never  
  - Within the past year  
  - Within the past 2 years  
  - Within the past 3 years  
  - Within the past 5 years  
  - 5 or more years |
| **Pap smear screening**     | **How long has it been since you had your last Pap or VIA test?** | **The following responses were used for women 21-65:**  
  - Never  
  - Within the past year  
  - Within the past 2 years  
  - Within the past 3 years  
  - Within the past 5 years  
  - 5 or more years |
