

DECLARATION OF COMMITMENT

Collective action to advance health for all

By endorsing Together for Science & Health, we affirm our commitment to advancing science as a global public good that serves health, equity, and societal wellbeing. We engage in this movement to promote scientific integrity, ethical responsibility, and social inclusion, and to strengthen the connection between science, policy, and society.

We commit to supporting evidence informed decision making, fostering transparent and trustworthy scientific processes, and participating in inclusive dialogue that values diverse knowledge systems and lived experience. Through collective action, collaboration, and responsible use of innovation, we seek to ensure that scientific progress translates into tangible and equitable health benefits for all, now and for future generations.

We commit to the following core principles:

- | | |
|----------|---|
| R | Respect for diverse knowledge systems
Science is enriched when it engages with cultural knowledge, lived experience, and community expertise alongside formal scientific evidence |
| I | Integrity and scientific rigor
Transparent methods, verification of results, reproducibility, and openness to critique are essential to credible and trustworthy science |
| S | Science as a public good
Science belongs to society and must advance collective well-being, reduce inequities, and serve present and future generations |
| E | Ethical responsibility and human rights
Scientific progress must respect dignity, promote equity, protect autonomy, and ensure safety anchored in strong ethical standards and human rights |
| S | Social inclusion and participation
Knowledge and decisions should include many different voices, especially those most affected, so they reflect society's needs and realities |

We commit to and agree to champion the shared **RISES** values of Together for Science & Health that ensure science remains credible, ethical and socially relevant in today's world.
