Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 11 of 2024 are presented in Table 1 below. Influenza A and B are co-circulating, however, about two third of cases reported in week 1 to week 11 of 2024 have been Influenza B (Victoria) (Figure 1). Caution should be taken when interpreting this data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator-based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included, and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted, and information is available.
The **WHO surveillance case definition** for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization.

Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

**Countries in the temperate zone of the Northern Hemisphere**

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are similar to the corresponding period from previous years.

**Outpatient ILI Surveillance**

**China (North)**

During week 11, sentinel hospitals in the northern provinces reported ILI% of 4.1%, which is higher than the last week (4.0%), higher than the same week of 2021-2022 (1.9% and 2.4%), lower than the same week of 2023 (7.7%) (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in northern China, 2020-2024 (as of week 11)](Source: China National Influenza Center)

**Mongolia**

There was no update in this reporting period. During week 45 of 2023, the ILI activity in Mongolia increased to 38 ILI cases per 10,000 population. This is above the upper tolerance limit (Figure 3).
**Influenza Situation Update**

*27 March 2024*

**Republic of Korea**

In week 11 (10 to 16 March 2024), the overall weekly influenza-like illness (ILI) rate was 15.1 per 1,000 outpatient visits, which was higher than the rate recorded in the previous weeks (12.8 in week 8) (**Figure 4**).

**Sentinel influenza surveillance**

**Japan**

In week 10 of 2024, the weekly number of cases reported by sentinel hospital sites in Japan slightly increased compared to the previous week. (**Figure 5**).
Countries/areas in the tropical zone

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 11, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPC) was 10.1 ILI cases per 1,000 consultations, which was higher than 8.1 recorded in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 55.5 ILI cases per 1,000 consultations, which was lower than 59.9 recorded in the previous week (Figure 7).

**China (South) - ILI Surveillance**

During week 11, the percentage of outpatient or emergency visits for ILI (ILI%) at national sentinel hospitals in southern provinces was 5.4%, lower than the last week (5.5%), higher than the same week in 2021 - 2022 (2.8% and 4.3%), lower than the same week of 2023 (9.9%) (Figure 8).
Influenza Situation Update

Bi-weekly Influenza Situation Update
27 March 2024

Singapore – Acute Respiratory Infection (ARI) Surveillance

In week 11 (10 to 16 March 2024), the average daily number of patients seeking treatment in the polyclinics for ARI is 2,134 (over 5.5 working days) (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.4%. The overall positivity rate for influenza among ILI samples (n=318) in the community was 22.6% in week 11. Of the 399 specimens tested positive for influenza in February 2024, 135 were positive for Influenza A(H3N2) (34%), 57 were positive for Influenza A(pH1N1) (14%), and 207 were positive for Influenza B (52%) (Figure 10).

Lao PDR

During week 11 (11 to 17 March 2024), the National Center for Laboratory and Epidemiology received data from all sentinel sites in Lao PDR. The number of ILI cases presenting at sentinel sites slightly increased compared to the previous week (Figure 11). There were 97 samples tested for influenza in
week 11 of 2024, of which 7 positive: Influenza A/pdmH1N1 (n=2), Influenza A/H3 (n=2), and Influenza B-Victoria (n=3).

Cambodia

In week 10 of 2024, the Ministry of Health received data from all seven sentinel sites in Cambodia. The number of ILI cases in Cambodia has slightly increased in week 10 (183 cases) compared to week 9 (164 cases). However, the positivity rate slightly increased from 19% in week 10 to 20% in week 11 (Figure 12).

Note: Starting from week 2 of 2024, the ILI surveillance has been updated as follows: a) Changed case definitions of ILI from >38°C (greater than 38) to ≥ 38°C (greater and equal to 38), b) Increasing number of samples per sentinel sites from 5 to 10 per week. Therefore, the number of cases and positivity might also increase.

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.
Australia – Laboratory-confirmed influenza

There is no update for this reporting period. In the year-to-date (1 January to 15 October 2023), there have been 251,095 notifications of laboratory-confirmed influenza reported to the National Notifiable Diseases Surveillance System in Australia. There were 6,037 laboratory-confirmed influenza notifications with a diagnosis date this fortnight (2 October to 15 October 2023), compared to 7,725 notifications in the previous fortnight. The number of notifications of laboratory confirmed influenza has continued to decrease since the peak in July (Figure 13).

*Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2016 to 2023 in Australia (Source: National Notifiable Diseases Surveillance System, Australian Department of Health)*

New Zealand – ILI Surveillance

There is no update for this reporting period. Indicators of influenza-like illness in the community remain low. The rate of ILI related Healthline calls decreased in the second week of February but have increased over the past two weeks. ILI related calls to healthline are currently below the rates seen at the same time in 2023. The percentage of FluTracking participants with fever and cough has been increasing since the end of January and is slightly above the percentage seen at the same time in 2023 (Figure 14).

Pacific Island Countries and Areas (PICs) - ILI Surveillance

There is no update for this reporting period.

In week 9 (26 February to 3 March 2024), 18 out of 21 PICs reported ILI surveillance data. No reports are available for American Samoa, Guam and Nauru. Cook Islands, Fiji, Micronesia (Federated States of), New Caledonia, Northern Mariana Islands, Samoa, Tonga, and Wallis and Futuna observed a slight increase in ILI trend compared to the past week (Figure 15).
**Figure 15: Reported cases of influenza-like illness in Pacific Island Countries, 2019-2024**
(Source: Pacific Syndromic Surveillance System Weekly Bulletin)

* Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
